Hiring Manager

Revel

Dear Hiring Manager,

My name is Ajay Venkatesh. I'm finishing my M.S. in Computer Engineering at NYU, with production software experience at PwC in Bengaluru, a summer SDE internship at Amazon, and ongoing on-campus work at NYU's Novel AI Technologies. I'm writing about the Full Stack Software Engineer (Entry-Junior) role at Revel.

The role's combination of browser-based UIs and backend services that drive mission-critical hardware sits where my full-stack work has been concentrated. At NYU's Novel AI Technologies I shipped a customer-facing analytics platform end-to-end using **React**, **Node.js**, **REST APIs**, deployed via **Docker** on **EC2**, with Stripe billing, role-based access, and row-level security for paying clients. I worked across the stack from data flow to system performance to reliability, which is exactly the shape the JD describes.

On user-facing work: at Amazon I built a **React 18** frontend with optimized API integration, advanced filtering, and client-side caching that materially reduced page load times. Designing UI for operators who need fast, reliable interfaces against real backend data is closer to industrial-hardware work than typical consumer web.

On backend and APIs: I engineered backend services in **Java** (Coral, Smithy, Dagger, CBOR) at Amazon with low-level design patterns and unit / integration testing via **Mockito**. At Campus Mesh I built **Node.js microservices** powering real-time academic workflows for thousands of users backed by **MongoDB**. Building APIs that frontend can rely on and that hold up under real load is the work I want to keep doing.

Stack-wise: **JavaScript**, **TypeScript**, **React**, **Node.js**, plus **Python**, **REST APIs**, **PostgreSQL**, **MongoDB**, **Docker**, and **AWS**. Comfortable collaborating with engineers across hardware, firmware, and ops boundaries.

What pulls me toward Revel is the layer of the problem. Building software that controls critical hardware introduces real consequences that pure consumer web doesn't have, and getting the UI right for operators who depend on it is engineering judgment that compounds.

I'd welcome the chance to discuss further. Thanks for considering my application.

Sincerely,

Ajay Venkatesh
