Hiring Manager

Uber

Dear Hiring Manager,

My name is Ajay Venkatesh. I'm finishing my M.S. in Computer Engineering at NYU, with production software experience at PwC in Bengaluru, a summer SDE internship at Amazon, and ongoing on-campus work at NYU's Novel AI Technologies. I'm writing about the Application Developer L3 role on the Identity and Access Management (IAM) team.

The role's combination, building secure and scalable identity solutions with strong production reliability, maps closely onto the work I shipped at Amazon. I architected a secure data console for fulfillment-center teams with role-based access control across multiple roles enforced through **OAuth**, **Midway SSO**, and **HELIS**, exactly the kind of authentication, access management, and identity lifecycle work the JD describes. I provisioned the supporting infrastructure with **AWS CDK** (Lambda, API Gateway, DynamoDB, IAM, CloudWatch) and operated multi-stage, multi-region CI/CD with rollback controls.

On backend integration work: I shipped backend services in **Java** (Coral, Smithy, Dagger, CBOR) with low-level design patterns and unit / integration testing via **Mockito**, all under code-review discipline. I also built a high-throughput, event-driven processing system on **AWS ECS Fargate**, **SQS**, **SNS** that decoupled distributed message handling under variable load. APIs, connectors, workflows, and automation for identity-style production systems are the kind of work I've already been doing.

On security and production hygiene: NYU's customer-facing analytics platform shipped with role-based access, row-level security, and Stripe billing for paying clients. PwC's distributed backend on **Microsoft Azure** integrated with **Microsoft CRM** via event-driven processing and fault-tolerant retries over **SQL Server**. Operational reliability under real authentication load is the baseline.

Stack-wise: **Java**, **Python**, **TypeScript** / **JavaScript**, plus **AWS**, **Docker**, **Kubernetes**, **REST APIs**, **SQL**, and distributed-systems debugging via logs, metrics, and traces. Comfortable with **OAuth** / **SAML** / **SSO** patterns and access-control models.

What pulls me toward Uber IAM is the leverage. Identity sits at the security layer that every Uber service depends on, where engineering decisions compound across the entire product surface and getting it right matters far beyond any single team.

I'd welcome the chance to discuss further. Thanks for considering my application.

Sincerely,

Ajay Venkatesh
