Hiring Manager

Doowii, Inc

Dear Hiring Manager,

My name is Ajay Venkatesh — finishing my M.S. in Computer Engineering at NYU, with several years of production software experience: a few years at PwC in Bengaluru, a summer SDE internship at Amazon, and ongoing on-campus work at NYU’s Novel AI Technologies. My focus has been on backend systems and the practical AI layer — **LLM-powered features**, **RAG pipelines**, and **embedding-based retrieval** grounded in real product workflows.

Doowii’s posting hits a few of my strongest threads. The core problem — translating natural language queries into SQL against imperfect, real-world data — is exactly the kind of work I’ve been gravitating toward. At Campus Mesh I built **CampusIQ**, an LLM-powered AI assistant for students, with iterative **prompt engineering** and **RAG retrieval** over structured data and **embedding-based semantic search**. The work was less about model novelty and more about the unglamorous engineering: schema-aware retrieval, query rewriting, evaluating outputs against messy data, and tightening the loop between what users ask and what the system actually returns.

What pulls me toward Doowii specifically is the education angle. My on-campus product work at NYU has been in education and academic workflows for thousands of students — the same population your platform serves. I’ve spent enough time in that domain to know that “answer this question about your data” is harder than it looks: schemas drift, users phrase the same question in many ways, and a wrong-but-confident SQL response is worse than no response at all. That’s a problem I’d actively want to work on.

Stack-wise, I’m fluent in **Python** for backend and ML pipelines, **SQL** for the analytical layer (PostgreSQL, MySQL, BigQuery, DynamoDB), and **JavaScript / TypeScript / React** for the product surface. At PwC I built a distributed Azure backend with event-driven processing over SQL Server; at Amazon I provisioned serverless infrastructure on AWS CDK and shipped React 18 UIs. The early-career framing fits where I am — finishing my M.S. in May 2026 — and the role’s mix of product features, data modeling, and integrations is exactly the kind of breadth I want to keep building.

I’d welcome the chance to discuss how I could contribute to Doowii’s engineering team. Thanks for considering my application.

Sincerely,

Ajay Venkatesh
