Hiring Manager

SAP SuccessFactors

Dear Hiring Manager,

My name is Ajay Venkatesh — finishing my M.S. in Computer Engineering at NYU, with several years of production software experience: a few years at PwC in Bengaluru, a summer SDE internship at Amazon, and ongoing on-campus work at NYU's Novel AI Technologies. My focus has been on **enterprise-grade backend systems, cloud-native deployments**, and the practical **AI layer** — LLM-powered features, RAG pipelines, and agentic workflows on top of real production systems.

The SuccessFactors posting maps onto my strongest threads. At PwC I spent three years on a distributed backend on **Microsoft Azure** for a health platform, integrating with **Microsoft CRM** via event-driven processing and fault-tolerant retries over **SQL Server** — the shape of multi-tenant HCM work: enterprise data, system-of-record integrations, and reliability under load. At Amazon I built a **React 18** frontend with optimized API integration, paired with backend services in **Java** (Coral, Smithy, Dagger, CBOR) with unit/integration testing via **Mockito**, and provisioned **AWS CDK** infrastructure (Lambda, API Gateway, DynamoDB, IAM, CloudWatch) with multi-stage, multi-region CI/CD.

On AI: I deployed a **Retrieval-Augmented Generation** pipeline with an **agentic workflow** at Amazon, implemented a **Model Context Protocol (MCP)** server that materially reduced query time and compute costs, and built RAG systems on **AWS Bedrock** with FAISS indexing. The HCM space is an obvious next frontier for AI — personalized learning paths, intelligent talent matching, agent-driven workflow automation — and that's where I want to keep building.

What pulls me toward SuccessFactors is the talent-platform problem itself. Performance, learning, recruiting, succession — these are workflows where AI moves the needle beyond keyword search because the data is irregular and behavior-driven. At Campus Mesh I built a recommendation engine on collaborative filtering and behavioral signals, and CampusIQ, an LLM-powered assistant with prompt engineering and embedding-based semantic search — small scale next to SuccessFactors's enterprise customer base, but the same family of problem.

Stack-wise: **Java, Python, TypeScript / JavaScript, React**, cloud microservices on **AWS** and **Azure** with **Docker** and CI/CD, and **SQL** (PostgreSQL, SQL Server, DynamoDB). I'd welcome the chance to discuss how I could contribute. Thanks for considering my application.

Sincerely,

Ajay Venkatesh
