SUMMARY

Software Development Engineer with 3+ years of experience specializing in Python-based backend development, scalable systems, and cloud-native applications using AWS. Designed a scalable backend system to unify third-party integrations, cut redundant API calls, and reduce data costs by 40%. Engineered an asynchronous batch processing system to handle 100K+ daily requests for credit assessment. Honored as a top performer in February 2024 for exceptional contributions and outstanding results.

EXPERIENCE

KreditBee - Software Development Engineer

March 2022 – Present

Centralized Data Integration Platform-

- Designed a scalable back-end service to integrate third-party data sources (credit bureau APIs), normalize raw data into a unified schema, and store it in structured, query-able tables—streamlining downstream usage and minimizing format-specific complexity.
- Implemented DE-dupe strategies, reducing repetitive external API calls and decreasing third-party data costs by 40%.
- Built a resilient fallback orchestration system to route requests to alternate providers during failures, cut down system downtime impact by 80%.
- Streamlined data recovery pipelines using scheduled jobs, bringing down manual retries and improving system availability by 90%.

Automated Risk Scoring and Financial Insights Engine

- Built a rules-based engine to extract and compute customer financial metrics from external data sources, used for credit scoring and eligibility assessment.
- Developed modules for income and liability estimation, minimizing reliance on user-submitted inputs for more accurate decisions.
- Enhanced credit risk evaluation process by integrating a financial ratio (FOIR) computation engine, mitigating high-risk approvals and bolstering the stability of the loan portfolio by 22%.

High-Throughput Asynchronous Data Processing Framework

- Engineered an asynchronous batch pipeline designed for 100K+ daily credit assessment workloads, enabling efficient parsing, transformation, and storage.
- Optimized concurrency and parallelism in processing workflows to support real-time scoring alongside batch ingestion, improving throughput and system responsiveness.

Rule-Based Credit Decision Automation Engine

- Constructed a configurable rule engine to automate loan decisions, credit limit setting, and risk classification based on financial data.
- Achieved 8% increase in approval rates while lowering risk exposure through real-time creditworthiness checks and decision explain-ability.

PERSONAL PROJECTS

Cleaning Slot Booking CRM | Django, Python, SQL

- Built a web-based CRM system for a B2C cleaning service to manage customer data, slot bookings, and service schedules.
- Integrated real-time slot availability, automated booking workflows, and admin dashboards, increasing operational efficiency and reducing manual scheduling effort.

EDUCATION

Dr Ambedkar Institute of Technology (VTU) – 8.9 CGPA

August -2021

ACHIEVEMENTS

- Received performance recognition in February 2024 for delivering exceptional results.
- Received the ‘**Best Team of the Year**’ award as part of the Portfolio and Origination Team, recognizing outstanding contributions and collaboration.

SKILLS

Languages: Python, SQL

Databases: MySQL, Redis

Frameworks: Django, Flask

Messaging/Task Queues: AWS SQS, Celery

Cloud Services: Amazon Web Services, Lambda, API Gateway, SQS, SNS, EC2, Athena, S3, CloudWatch.

Developer Tools: Git, Nginx, Docker, Postman, Redash, Linux
