Hiring Manager

Goldman Sachs

Dear Hiring Manager,

My name is Ajay Venkatesh. I'm finishing my M.S. in Computer Engineering at NYU, with production software experience at PwC in Bengaluru, a summer SDE internship at Amazon, and ongoing on-campus work at NYU's Novel AI Technologies. I'm writing about the Associate, Software Engineering role.

The strongest match is the backend work I owned at Amazon. I engineered services in **Java** using **Coral**, **Smithy** models, **Dagger** dependency injection, and **CBOR** serialization, applying **low-level design patterns** and writing unit and integration tests in **Mockito**. The systems were **multi-threaded**, sat across multiple service tiers, and were deployed under tight code-review discipline through a multi-stage and multi-region pipeline on **AWS CDK**. That blend of disciplined Java, multi-threaded programming, microservice contracts, and a strict SDLC is the closest analogue I have to the work the role describes.

In parallel, at PwC I owned a distributed backend on **Microsoft Azure** integrating with **Microsoft Dynamics CRM** over **SQL Server**, with asynchronous message processing, fault-tolerant retries, and parallelized batch ingestion of large data feeds. I worked across requirements gathering, design, development, testing, UAT, and deployment under a regulated PwC SDLC governance model with strict review gates. I'm comfortable producing thoughtful designs in environments where audit, compliance, and signoff are part of the daily reality.

At NYU and Campus Mesh I've shipped customer-facing platforms on **React**, **Node.js**, and **REST APIs** backed by **PostgreSQL** and **MySQL**, with **RBAC**, row-level security, billing flows, and **Kafka-style asynchronous messaging**. I've designed schemas end to end, tuned hot-path queries, and supported live customers.

Stack-wise: **Java**, **C++**, **Python**, **JavaScript / TypeScript**, **SQL Server / PostgreSQL / MySQL**, **Kafka**, **REST**, **microservices**, **multi-threaded programming**, **Unix / Linux**, **Git**, and **Docker** as daily tools. Comfortable in IntelliJ and Visual Studio, comfortable debugging production incidents through logs and metrics.

What pulls me toward Goldman Sachs is the seriousness of the surface. The Firm's software has to be correct under regulatory scrutiny, durable under market load, and continuous over years and years of business cycles. That kind of engineering, where the work has real consequences in real currency for real clients, is exactly the environment where I want to compound my career. The breadth of the platforms behind the global businesses also means the work is genuinely durable engineering, not throwaway product code.

I'd welcome the chance to discuss further. Thanks for considering my application.

Sincerely,

Ajay Venkatesh
